Rising Temperature??

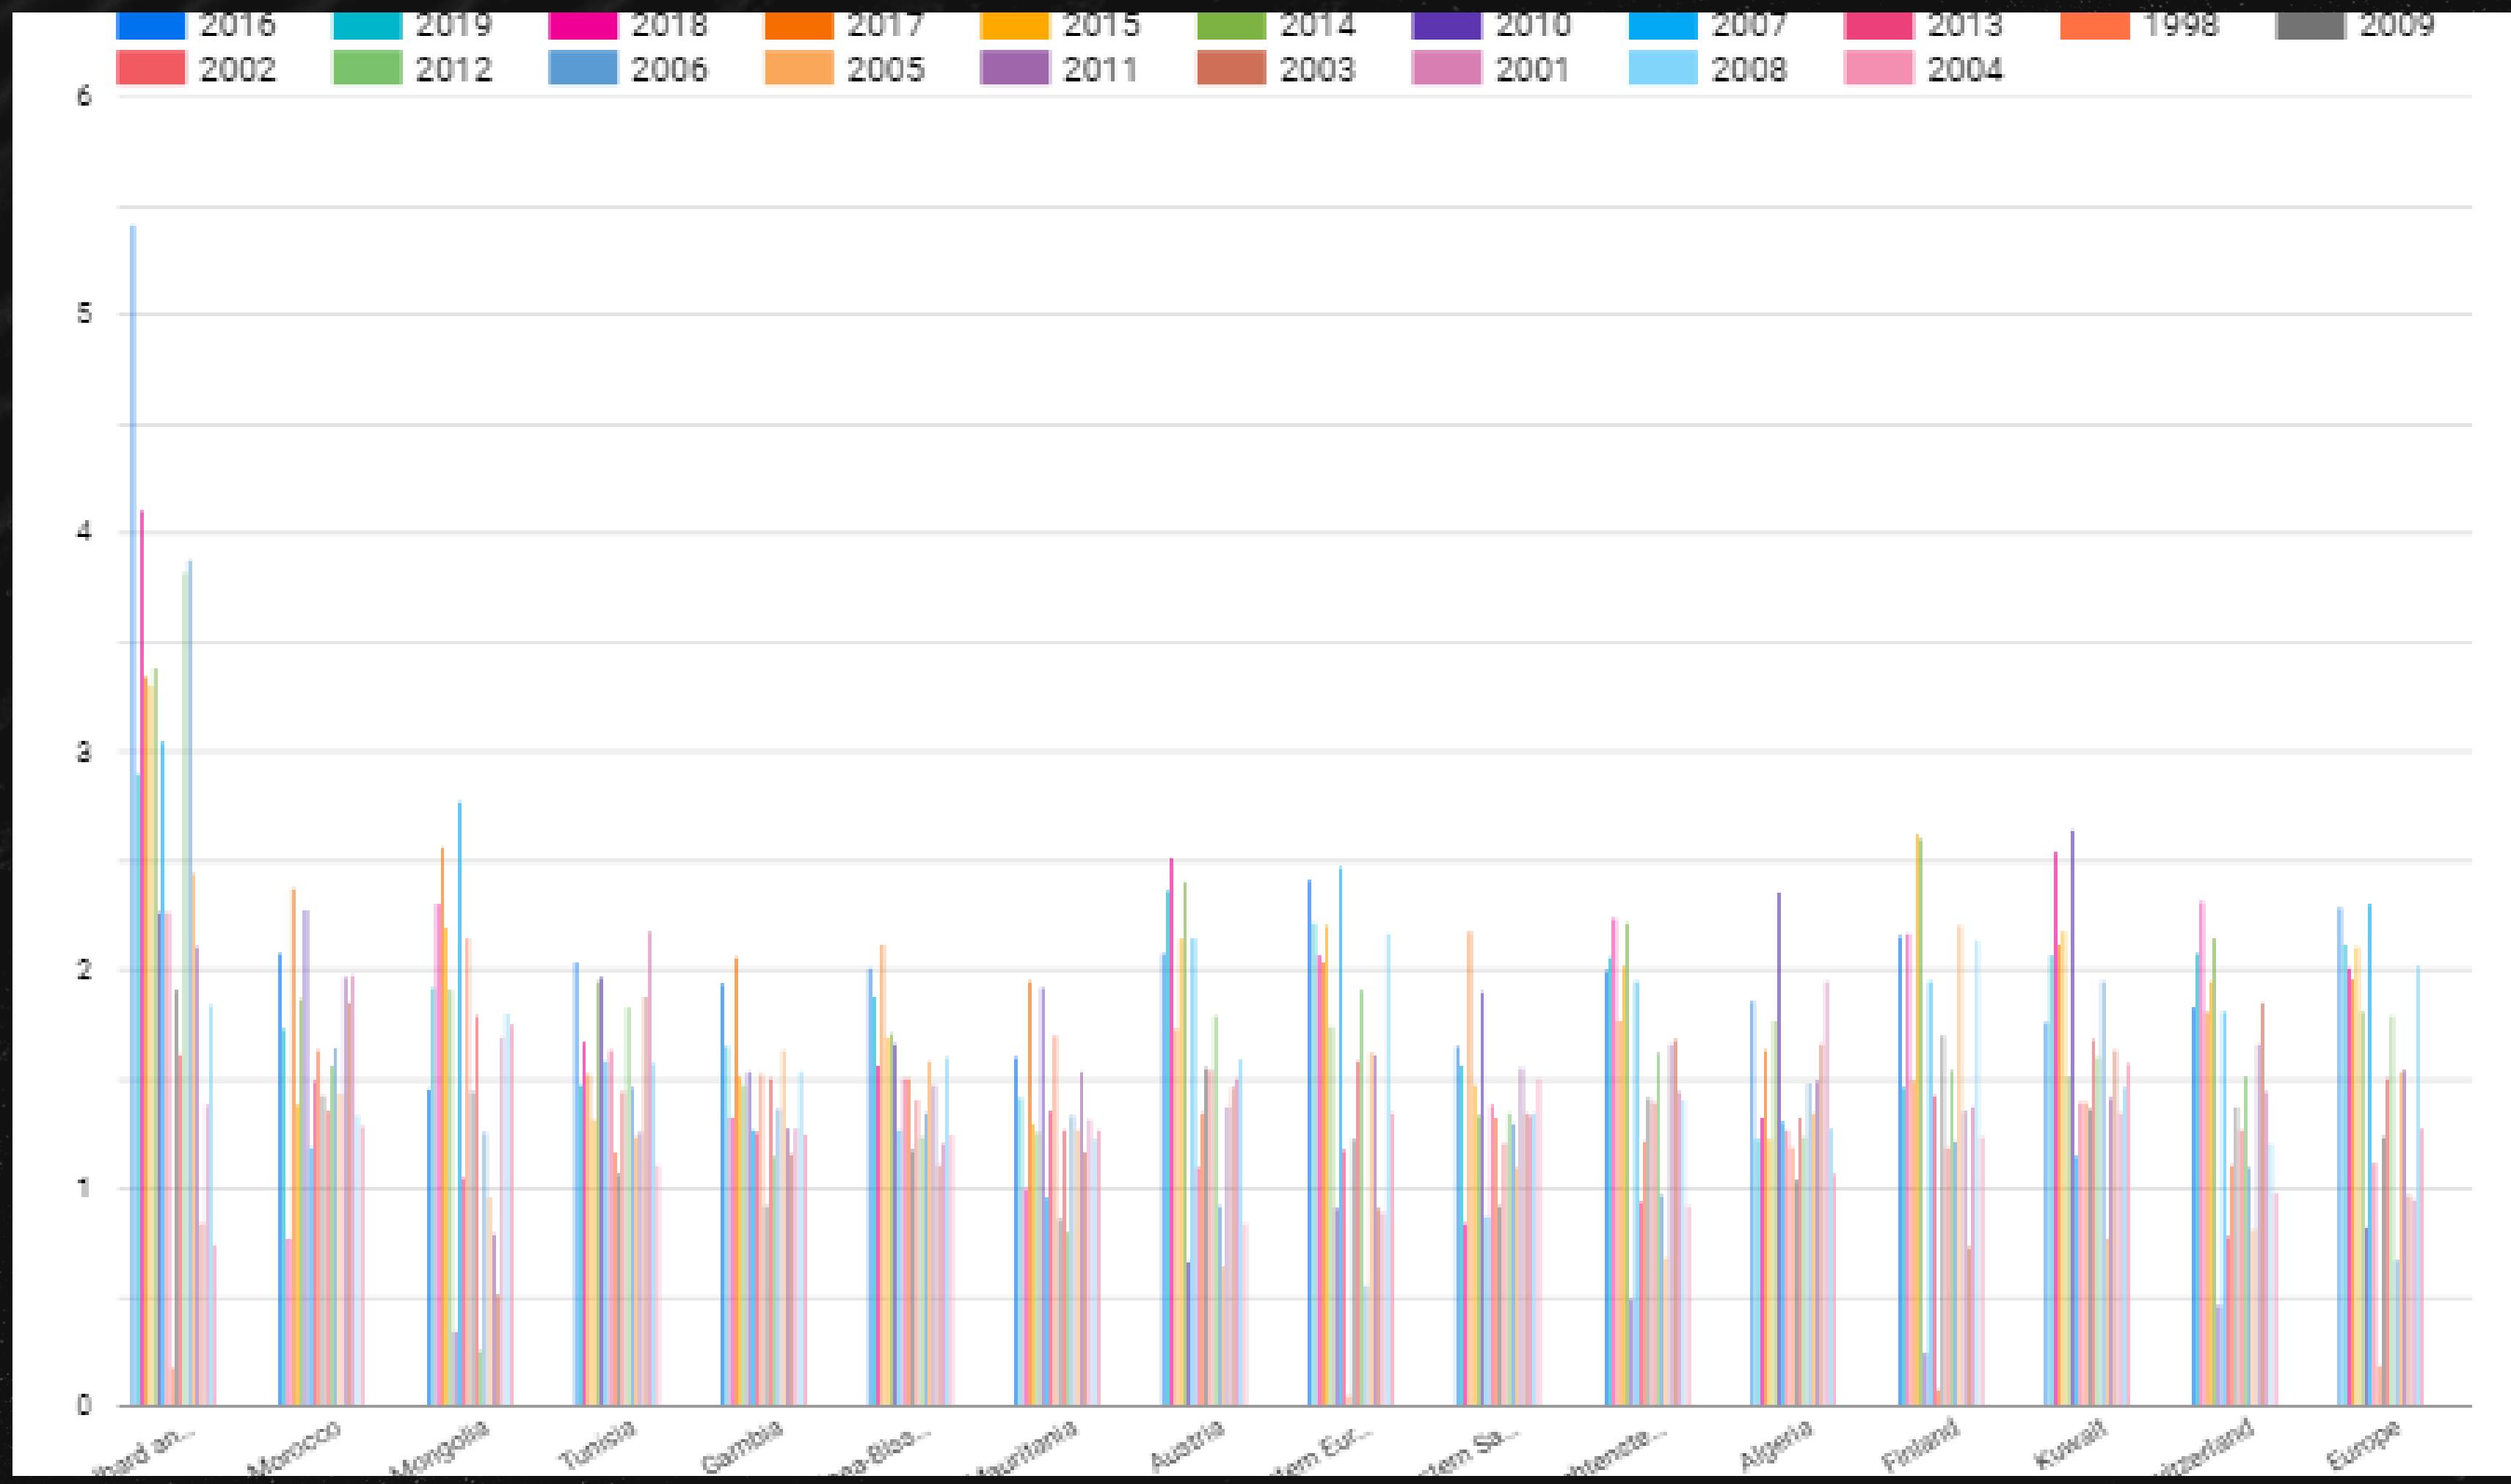

As we know that food is one of the basic necessities for survival, and due to use of nonrenewable resources the temperature of the environment is being drastically increased day by day and higher temperatures eventually reduce yields of desirable crops while encouraging weed and pest proliferation. Thus increasing food hunger. The most well-known impact of using non-renewable energy sources is the emission of greenhouse gases, in particular carbon dioxide and methane, which contribute to climate change. Different types of non-renewable energy fuels emit different levels of greenhouse gases.

WE WENT FROM THIS

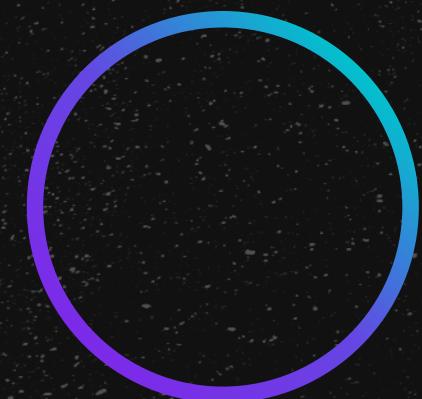

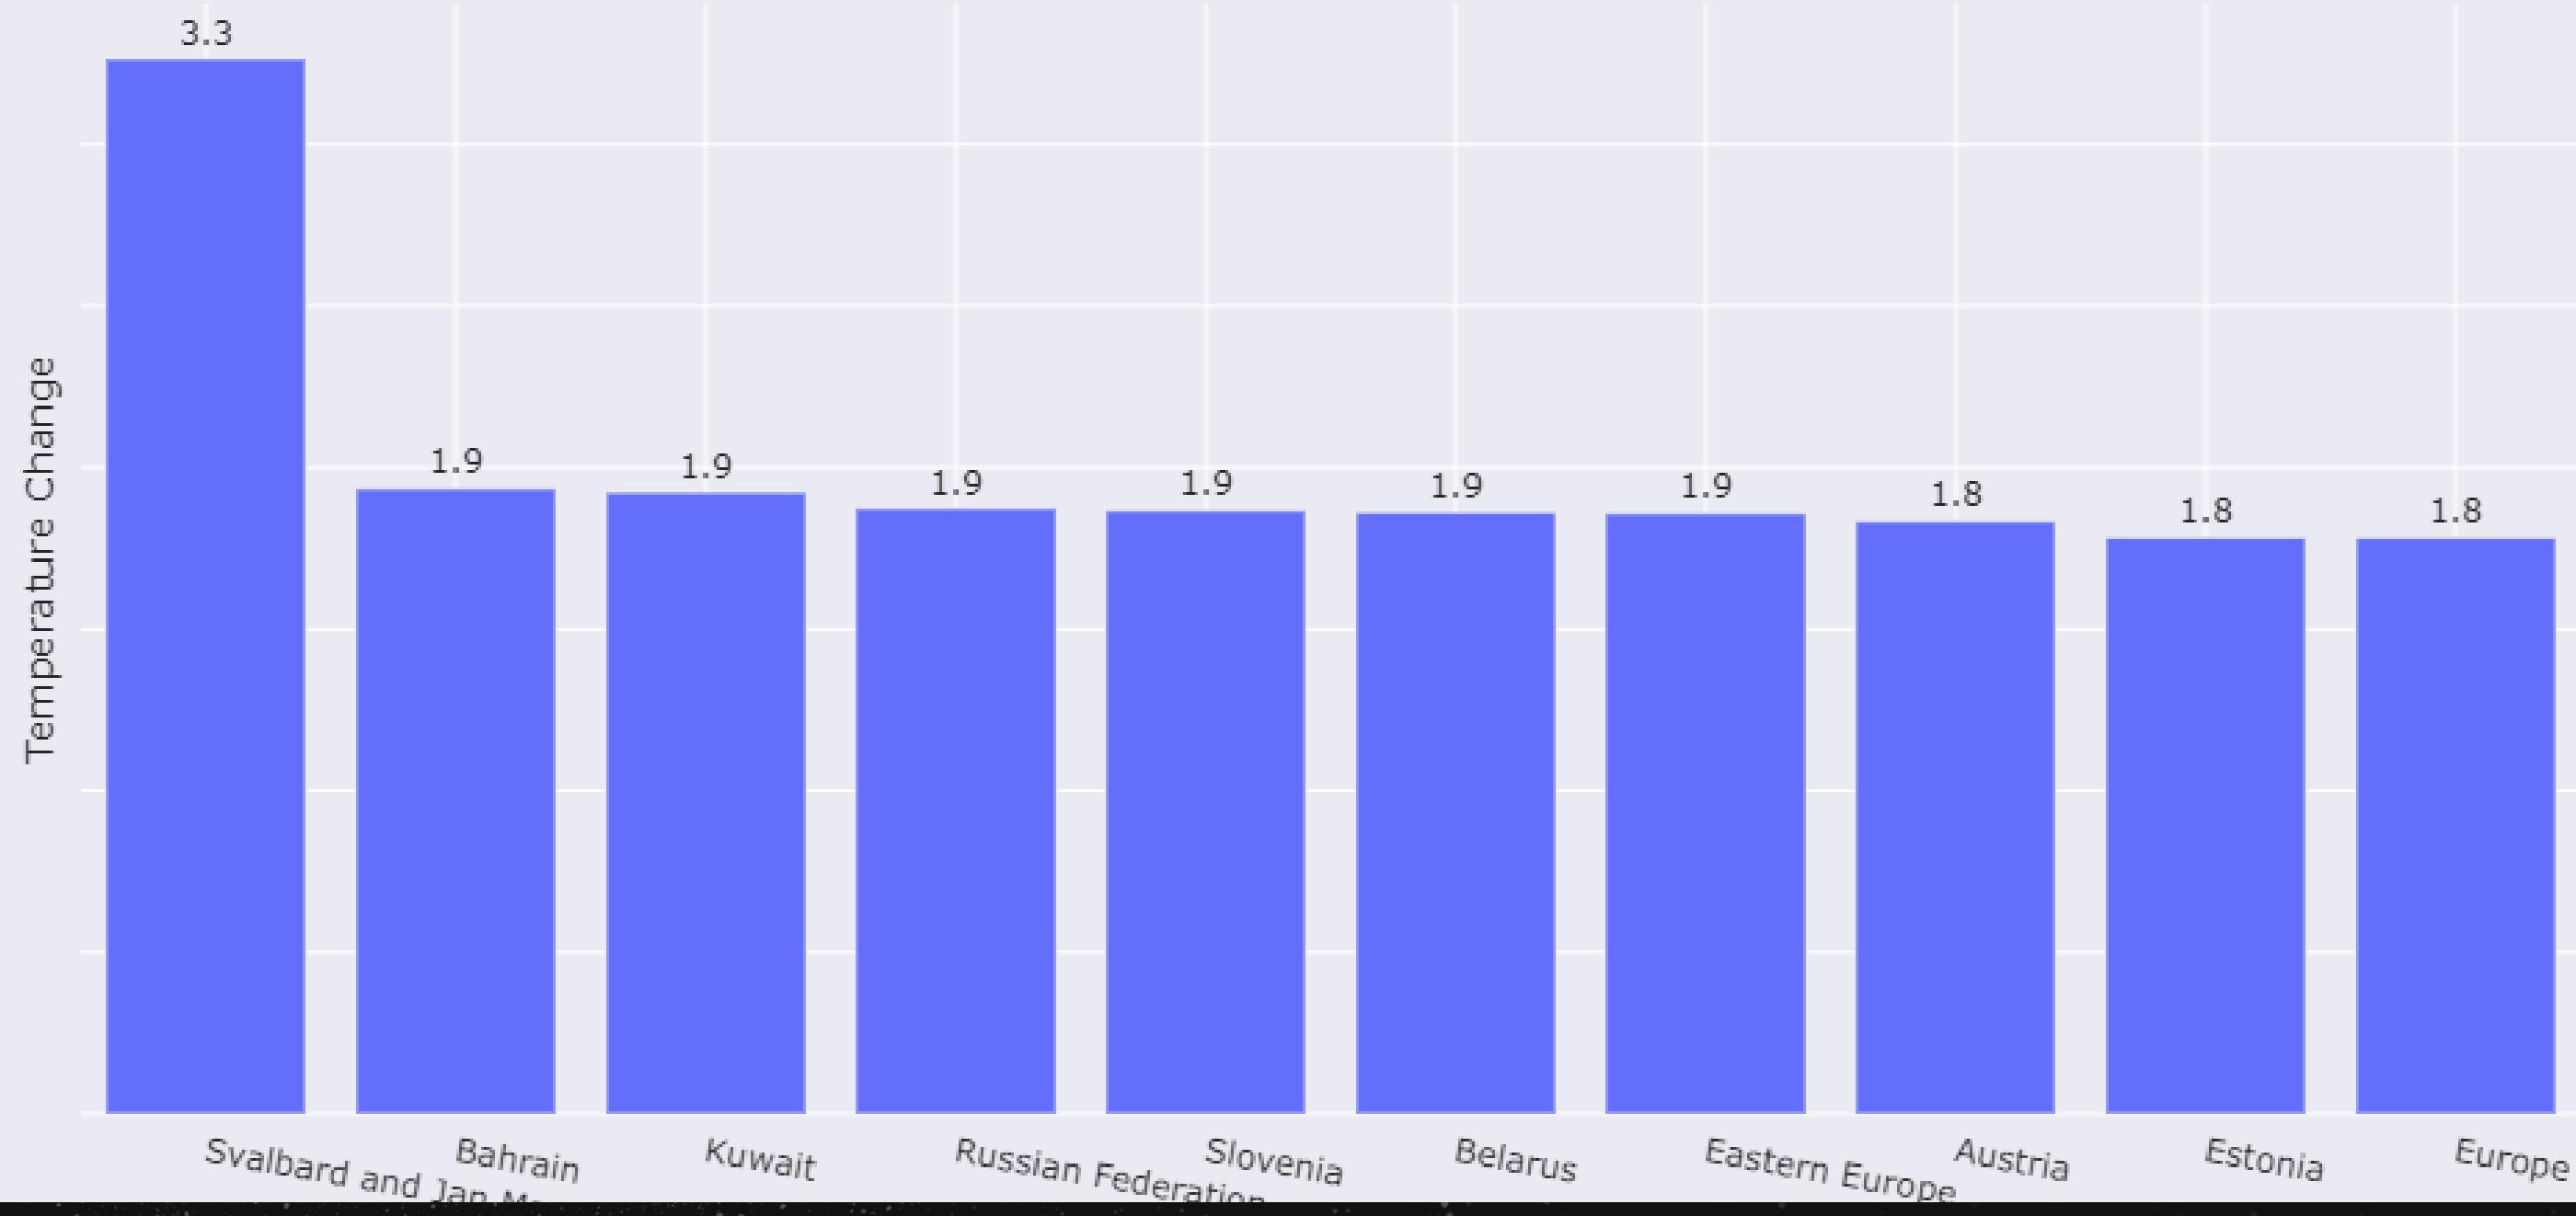

TO THIS

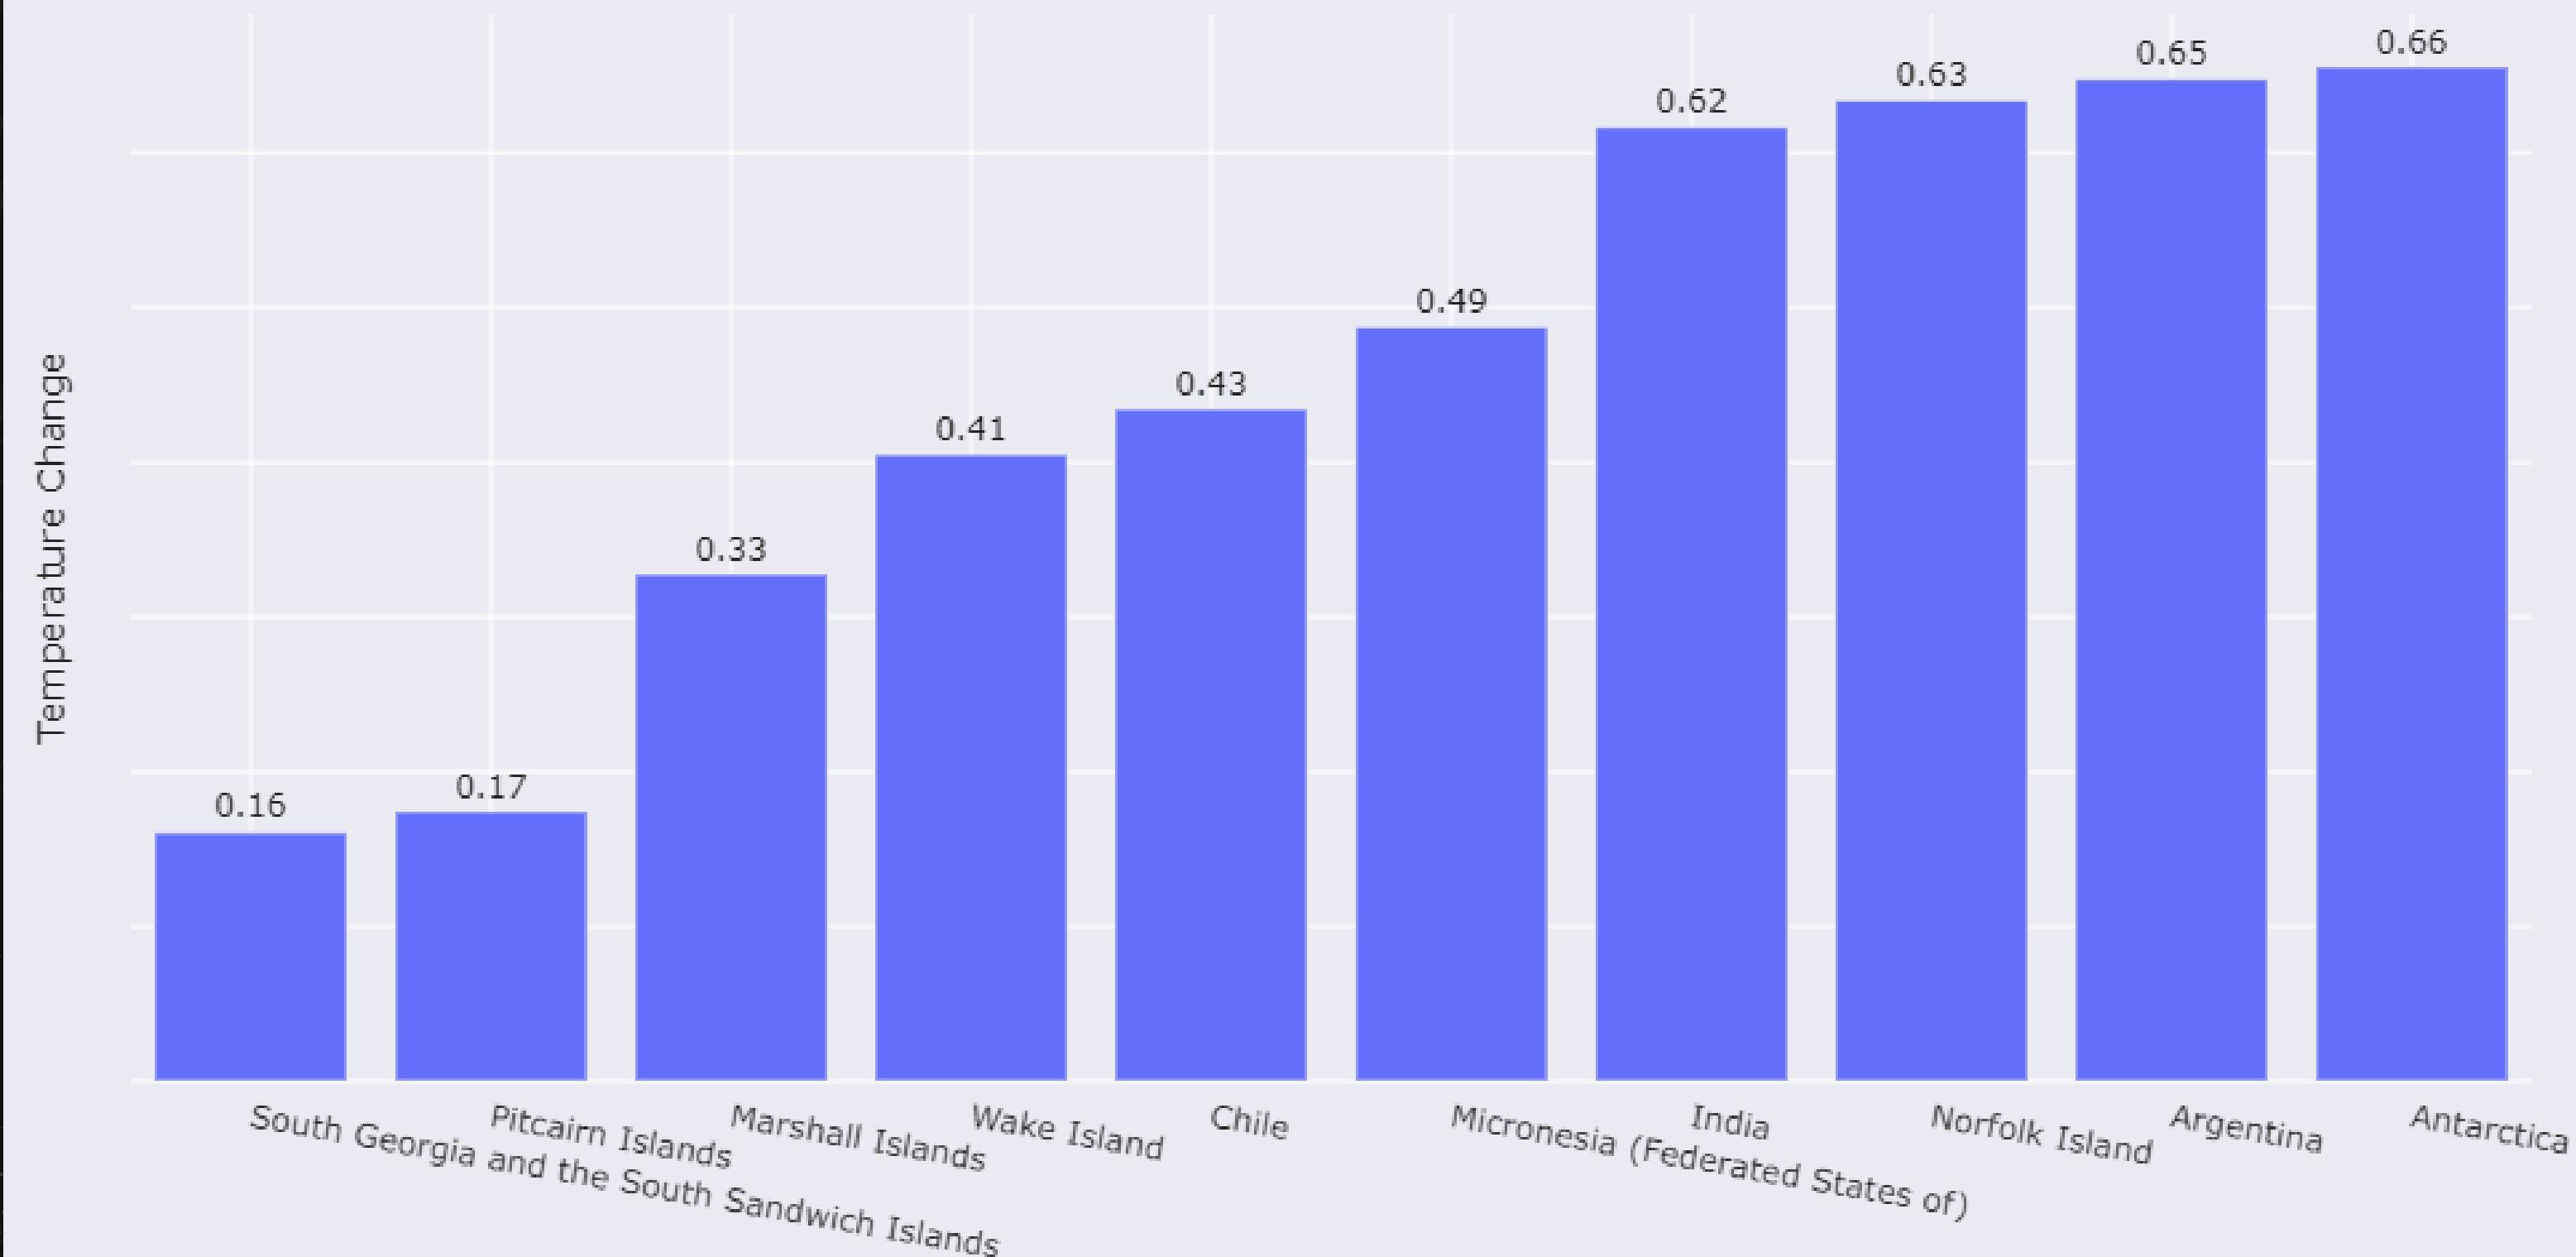

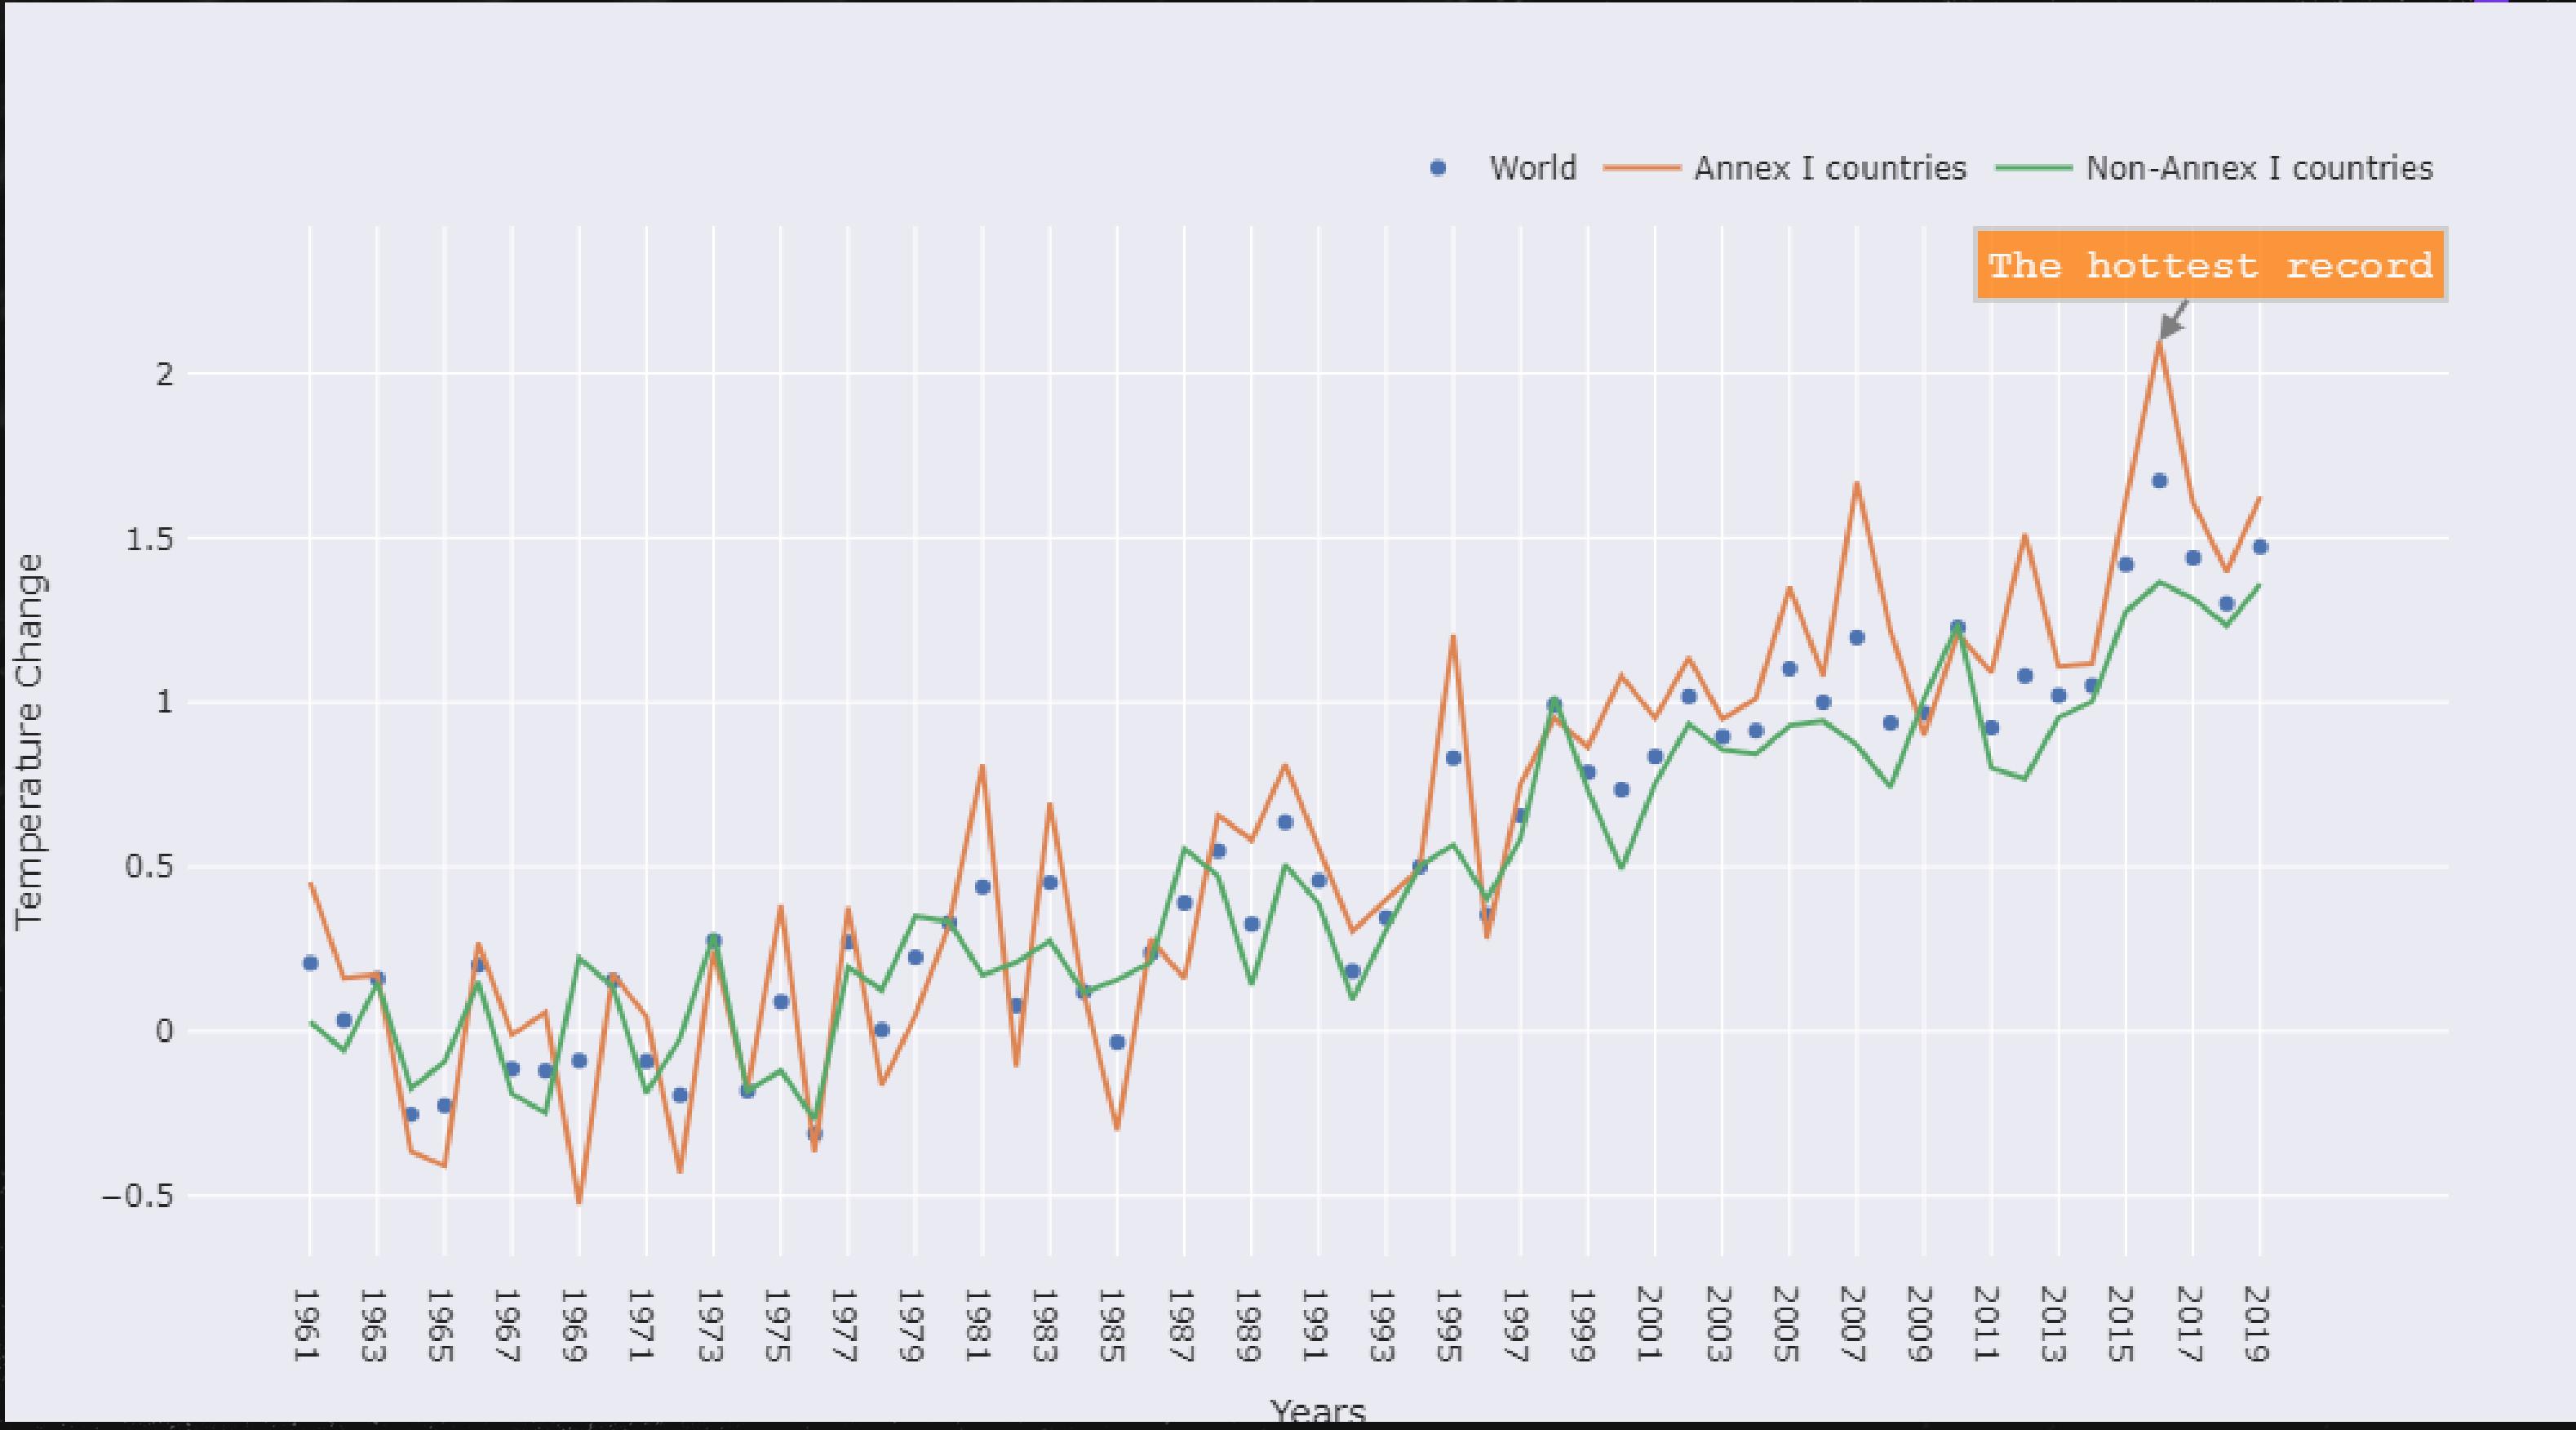

Top ten countries that have highest temperature change in the last decades

Top ten countries that have lowest temperature change in the last decades

Use the renewable resources.

**THANK YOU
VERY MUCH!**
